

AT&T M2X Tutorial: Using cURL

You can easily interact with the M2X API using cURL, a powerful command-line tool for making HTTP calls.

Pre-requisites: Windows 7 or later, or Mac OS X 10.7 or later (for this guide) cURL itself works with almost any OS. You can find a full list here:

<http://curl.haxx.se/docs/install.html>

cURL is already installed on computers running Mac OS X.

Downloading and Installing cURL on Windows

Use the following steps to install cURL:

1. Open <http://curl.haxx.se/dlwiz?type=bin> in a browser.
2. Select your operating system in the dropdown box: either Windows, /Win32 or Win 64. Click **Select!**
3. For Win 32, choose whether you will use cURL in a Windows Command Prompt (Generic) or in a Cygwin terminal (cygwin). For Win 64, choose whether you will use cURL in a Windows Command Prompt (Generic) or MinGW (MinGW64). Click **Select!**
4. If required, choose your Windows operating system. Finish.
5. Click **Download** for the version which has SSL enabled.
6. Choose a version with support for SSL. Choose a zip file.
7. Open the downloaded zip file. Extract the files. Move curl.exe (it might be in the bin folder) to an easy-to-find place, such as **C:\Program Files**.

Testing cURL on Windows

Follow these steps:

1. Open up the Windows Command Prompt terminal. (In Windows 7, from the Start menu, click Run, then type cmd. In Windows 8, from click the Start menu and type cmd.)
2. Set the path to include the directory where you put curl.exe. For example, if you put it in C:\Program Files\curl, then you would type the following command:

```
set path=%path%;"c:\Program Files\curl"
```

3. Now, type `curl`
4. You should see the following message:

```
curl: try 'curl -help' or 'curl -message' for more information
```

This means that cURL is installed and the path is correct. Type:

```
curl -k https://api-m2x.att.com/v1
```

You should see JSON returned:

```
{ "message": "You must provide a valid API key in the X-M2X-KEY header" }
```

Testing cURL on Mac OS X

cURL is installed by default in Mac OS X. To test cURL:

1. Open up the Terminal application. (Terminal can be launched from Spotlight, the Dock at the bottom of the screen or even the Applications folder).
2. Type `curl`
3. You should see the following message:

```
curl: try 'curl -help' or 'curl -message' for more information
```

This means that cURL is installed and the path is correct.

4. Now, type:
- 5.

```
curl -k https://api-m2x.att.com/v1
```

You should see JSON returned:

```
{ "message": "You must provide a valid API key in the X-M2X-KEY header" }
```

Advanced instructions

You can learn more about how to use cURL by visiting the official tutorials:
curl.haxx.se/docs/httpscripting.html

Troubleshooting

SSL certification error

If you see an SSL certification error, add a `-k` flag into your curl command.

HTTPS not supported error

If you get an error that says “Protocol http not supported or disabled in libcurl” then you need a different version of cURL. Make sure you have downloaded one that says SSL enabled. If you have downloaded the Win64 version, try the Win32 version instead, even if you are on a 64 bit machine.
